

## The Creative AI Privacy Blueprint

*How to use AI safely without risking client confidentiality.*

### 1. The Golden Rule

Assume anything you paste into a public AI model can be reviewed by third parties or used for model training. Never upload proprietary data.

### 2. The "Red Flag" List (Never Input)

- Identity: Real client names, brand handles, or internal project code names.
- Access: Account logins, passwords, or private staging links.
- Metrics: Internal financial figures, ad spend data, or private conversion rates.
- Raw Media: Unreleased scripts, raw client footage, or private audio files.

### 3. Mask Your Prompts (Anonymization)

Swap sensitive details with generalized, broader contexts so the AI can handle the strategy without knowing the exact client.

- Risky: *"Draft a video hook for [Brand Name]'s new unreleased virtual dollar card launching in Lagos next month."*
- Safe: *"Draft a video hook for a digital platform launching a virtual multi-currency card in an emerging tech market."*

### 4. GDPR & Media Compliance

- Opt Out of Training: Go to your AI account settings (e.g., ChatGPT Data Controls) and turn off chat history & training to keep your conversations private.
- Visual Privacy: Never upload raw footage or photos of real people into AI background removers, face-swappers, or enhancers without explicit consent.
- Commercial Rights: Ensure your AI tools do not claim ownership over the media you generate, protecting your client's intellectual property.

### 5. The 3-Second Check Before Hitting "Send"

1. Did I scrub all specific names, locations, and revenue numbers?
2. Is this prompt focused on the *framework/strategy* rather than the raw private data?
3. If this prompt leaked tomorrow, would it breach my client contract?
